

Press Release

PENN NATIONAL INSURANCE MOBILE APP LEVERAGES JARUS MOBILE SOLUTION

Penn National Insurance brings rich mobile experience to its policyholders with an extensive set of self-service features offered by Jarus Customer Center

Harrisburg, PA - Feb 1, 2014 – For Immediate Release

Penn National Insurance is leveraging the Jarus Mobile solution to address the explosive growth of smartphones and mobile devices, to meet the rapidly growing expectation of policyholders to have ready access to their policy information using these well connected devices.

Jarus Customer Center is a ready-to-deploy customer self-service solution for Insurers. It is set of highly customizable, native applications for iPhone, Android and Windows Phone with a rich set of features such as *Policy Inquiry, Online Payment, Accident Help, Submit Claim, and Policy Documents.*

Penn National Insurance is customizing and branding the mobile solution and integrating it with their core backend systems using existing web services. “This approach has reduced our time to market considerably, while not investing substantial resources in a mobile platform initiative” said Tim Caskey, Director of Enterprise Architecture at Penn National Insurance. “We wanted to provide a sound user experience to our policyholders while learning the complexities and support required to deploying a mobile application”.

The enterprise class Jarus Mobile solution is purpose-built to suit the specific needs of the insurance industry. It supports multitude of personal and commercial P&C lines. “In addition to the rich and native mobile apps covering all popular platforms, the real strength of Jarus Mobile solution is its overall architecture including secure middleware and the Jarus Mobile API for integrating with carrier backend”, said Sundar Vallinayagam, CEO of Jarus technologies.

Designed by Jarus for the Insurance industry, Jarus Mobile API is a set of standards based, language neutral RESTful services. These RESTful services facilitate multiple devices, using different languages and technologies to communicate with the carrier backend in a secure manner.
